SUMMARY

Technical product owner. Specified, architected and shipped Zoryvex, a live proof-first hiring platform on AWS serverless: 55 Lambda functions, 51 API routes, single-table DynamoDB, Terraform-managed infrastructure, live payments. Built and operated solo. Decisions documented in six architecture decision records, including two that removed shipped features because they could not be verified honestly.

EXPERIENCE

Founder and Technical Product Owner, Zoryvex Aug 2026 - Present

- Specified and shipped a live hiring platform verifying candidate claims against third-party sources: 55 AWS Lambda functions across 51 API routes, 44 behind a fail-closed authorizer, backed by single-table DynamoDB.
- Directed all architecture decisions and recorded them in six ADRs, including rejecting Amazon Cognito in favour of passwordless email auth with opaque server-side sessions, and choosing static export on CloudFront with origin access control over any always-on compute.
- Retired a shipped verification method after determining a language model could pass it from the published brief, accepting reduced product scope in exchange for a defensible claim.
- Removed two further evidence paths, file upload and peer confirmation, on the principle that a source the candidate controls or selects is not independent verification.
- Integrated Paystack with HMAC-SHA512 webhook verification, payload-hash deduplication and hourly reconciliation; proved forgery rejection, signature acceptance and replay deduplication against the live account.
- Diagnosed eleven consecutive live payment failures to gateway evidence: eight abandonments and three test cards presented to a live account. Concluded there was no product defect and changed nothing.
- Built deployment safety after shipping a demo build to production: the release process now refuses to build without an https API URL read from Terraform output, refuses to upload if a demo marker is present, and smoke-tests the deployed commit.
- Enforced cost control by design: reserved concurrency on all 55 functions, on-demand DynamoDB, no NAT Gateway, no always-on compute, and feature flags read per invocation for sub-minute mitigation without a deploy.
- Established data-minimisation boundaries: stated minimum pay never leaves the candidate record, contact details are released only after mutual interest and an entitlement check, and AI inputs exclude all contact and protected fields.

SKILLS

Cloud and infrastructure: AWS Lambda, API Gateway, DynamoDB, S3, CloudFront, SES, EventBridge, CloudWatch, Parameter Store, IAM, ACM, Terraform

Product: technical specification, architecture decision records, trade-off analysis, pricing strategy, privacy and data-minimisation design

Engineering practice: serverless architecture, single-table design, idempotency, webhook verification, feature flags, CI/CD, incident response

Payments: Paystack integration, webhook signature verification, reconciliation

Stack: TypeScript, Next.js, Node.js, GitHub Actions

EDUCATION

[DEGREE], [INSTITUTION], [YEAR]
